POST-TRAUMATIC STRESS DISORDER

DOD Needs to Identify the Factors Its Providers Use to Make Mental Health Evaluation Referrals for Servicemembers

What GAO Found

DOD offers an extended health care benefit to some OEF/OIF veterans for a specified time period, and VA offers health care services that include specialized PTSD services. DOD’s benefit provides health care services, including mental health services, to some OEF/OIF veterans for 180 days following discharge or release from active duty. Additionally, some veterans may purchase extended benefits for up to 18 months. VA also offers health care services to OEF/OIF veterans following their discharge or release from active duty. VA offers health benefits for OEF/OIF veterans at no cost for 2 years following discharge or release from active duty. After their 2-year benefit expires, some OEF/OIF veterans may continue to receive care under VA’s eligibility rules.

Using data provided by DOD, GAO found that 9,145 or 5 percent of the 178,664 OEF/OIF servicemembers in its review may have been at risk for developing PTSD. DOD uses a questionnaire to identify those who may be at risk for PTSD and the number referred for further mental health evaluations; and (3) examines whether DOD can provide reasonable assurance that OEF/OIF servicemembers who need further mental health evaluations receive referrals.

What GAO Recommends

GAO recommends that DOD identify factors that its providers use in issuing referrals for further mental health evaluations. DOD concurred with GAO’s recommendation, but disagreed with GAO’s finding that DOD has not provided reasonable assurance that servicemembers who need referrals for further mental health evaluations receive them. DOD identified factors that may affect referrals, but did not provide data on how its providers apply these factors. VA concurred with the facts related to VA in the report.

DOD cannot provide reasonable assurance that OEF/OIF servicemembers who need referrals receive them. According to DOD officials, not all of the servicemembers with three or four positive responses to the PTSD screening questions will need referrals for further mental health evaluations. DOD relies on providers’ clinical judgment to decide who needs a referral. GAO found that DOD health care providers varied in the frequency with which they issued referrals to OEF/OIF servicemembers with three or more positive responses; the Army referred 23 percent, the Marines about 15 percent, the Navy 18 percent, and the Air Force about 23 percent. However, DOD did not identify the factors its providers used in determining which OEF/OIF servicemembers needed referrals. Knowing the factors upon which DOD health care providers based their clinical judgments in issuing referrals could help explain variation in the referral rates and allow DOD to provide reasonable assurance that such judgments are being exercised appropriately.
