A Report to Congress

Child Well-Being
Key Considerations for Policymakers
Including the Need for a Federal Cross-Agency Priority Goal

The long-term success of a nation depends in large part on how well families and society care for their children. Child well-being can be measured through various indicators that reflect a child’s family, physical, and social environments, health, and education. This report examines what is known about the state of child well-being and discusses selected experts’ views on what policymakers could consider when addressing it. While many factors influence a child’s well-being, poverty—particularly early in life—can have long-term consequences in many areas, such as the ability to be successful in school and work. In 2016, about 18 percent of children in the United States lived in poverty, with some groups faring worse than others.

For this report, GAO reviewed published federal data on select child well-being indicators, and interviewed federal officials and officials from 18 organizations that conduct research on children and family issues, selected to provide balance and coverage by subject matter expertise and to provide a range of viewpoints.

Section 1: Federal Data Show That Child Well-Being Has Improved in Some Areas but Not in Others, and Children with Certain Characteristics Have Fared Worse than Others

In recent years, the well-being of children in the United States has improved in some areas but not in others, and well-being continues to be generally worse for children who are minority, poor, and/or from families headed by single mothers (compared to married parents), according to the federal data GAO reviewed. Federal data show higher high school graduation rates and a greater percentage of children who have health insurance, although this varied based on children’s characteristics.
Areas where children have fared worse over the last decade include depression and student homelessness. In school year 2014-15, about 1.26 million students were identified as homeless by public school districts, compared to less than one million in school year 2005-06.

The percentage of households with food-insecure children—i.e. children who do not have access at all times to enough food for an active, healthy life—stayed about the same over the last decade, with female-headed households having the greatest percentage of food-insecure children.

Experts interviewed by GAO expressed a range of viewpoints on how policymakers could address child well-being, such as considering the whole family when addressing the needs of children and coordinating efforts among federal, state, local, and non-governmental entities, among other areas.

Experts suggested that policymakers consider ways to support a family’s ability to provide the safe, supportive, and nurturing environment that children need. For example, some experts highlighted the role of policies that promote marriage or encourage the maintenance of two-income households.

With respect to coordination, experts discussed the importance of federal agencies coordinating with stakeholders inside and outside government to address child well-being. At the federal level, several experts suggested that efforts to address child well-being are hindered by insufficient coordination, noting that federal agencies generally lack the multidisciplinary structure needed for a coordinated approach. The Office of Management and Budget (OMB) is required to coordinate with agencies to develop federal government priority goals (known as cross-agency priority or CAP goals). These are long-term, outcome-oriented goals that cover a limited number of crosscutting policy areas. To date, child well-being has not been designated as a CAP goal. OMB is reviewing the current administration’s priorities to help develop new goals. By highlighting child well-being as an overarching priority area and ensuring that this priority is reflected in agencies’ strategic plans, OMB could help draw needed attention to federal efforts to improve child well-being.

GAO recommends that OMB consider developing a goal that addresses a coordinated federal approach to child well-being among its next set of cross-agency priority, or CAP, goals, including working with relevant agencies to ensure their strategic plans include related goals and objectives. OMB neither agreed nor disagreed with the recommendation and noted that it is currently in the process of developing the next set of CAP goals.
