OPIOID USE DISORDER

Treatment with Injectable and Implantable Buprenorphine

What GAO Found

Of the medications used to treat opioid use disorder (OUD), only buprenorphine is both a controlled substance and available as an injection or implant. Buprenorphine is used to treat patients with OUD because it reduces or eliminates opioid withdrawal symptoms and blunts the euphoria or dangerous side effects of other opioids, such as heroin. When used to treat OUD, buprenorphine, in any form, is subject to additional laws and regulations that are overseen by the Drug Enforcement Administration (DEA), within the Department of Justice (DOJ) and the Substance Abuse and Mental Health Services Administration (SAMHSA), within the Department of Health and Human Services (HHS). To ensure patient safety when injectable and implantable buprenorphine is used, the Food and Drug Administration (FDA), within HHS has also required drug companies to establish risk evaluation and mitigation strategies to help ensure the benefits of these medications outweigh their risks.

Providers and pharmacies must follow a number of specific steps based on federal requirements when providing treatment with injectable and implantable buprenorphine. Providers are responsible for prescribing, storing, and administering injectable and implantable buprenorphine, while pharmacies are responsible for dispensing these medications (see figure). Representatives GAO interviewed from provider groups and pharmacies said they did not find the steps involved in treating patients to be difficult overall. However, they stated that careful and timely coordination with each other and patients is needed at key steps of the process to ensure that the patient receives treatment.

Representatives from provider groups and pharmacies reported that the risk of diversion of injectable and implantable buprenorphine is low. For example, all of the provider groups GAO spoke with said that diversion of injectable or implantable buprenorphine is unlikely, and representatives from three of the six provider groups said that the design of these formulations reduces opportunities for diversion due to how they are administered.

Process for Treating Opioid Use Disorder with Injectable and Implantable Buprenorphine

The use of injectable and implantable buprenorphine to treat OUD is relatively low compared to oral forms of buprenorphine. HHS has reported that about 7,250 prescriptions were issued for injectable and implantable buprenorphine in fiscal year 2019, compared to over 700,000 patients who received buprenorphine prescriptions for oral formulations to treat OUD or pain in that year.
