United States General Accounting Office Fact Sheet for Congressional Requesters

September 1989

# AVIATION SAFETY

# Chicago Center Work Force Views of the Air Traffic Control System

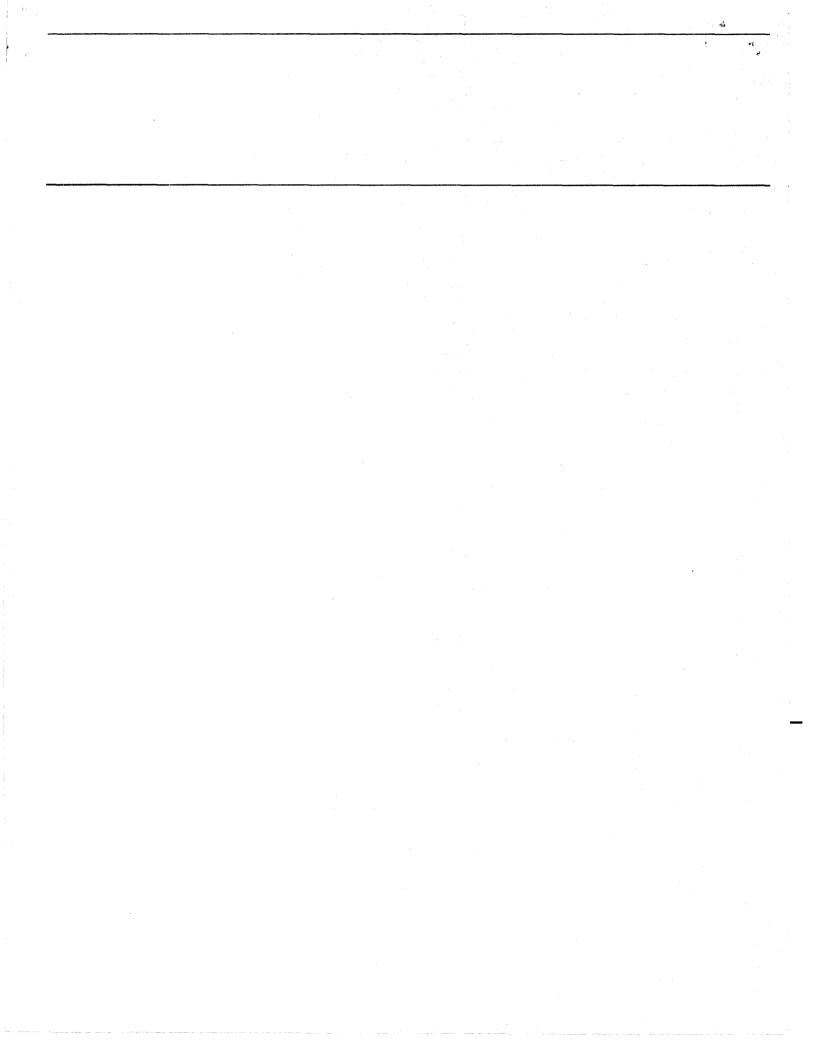

RESTRICTED —— Not to be released outside the General Accounting Office unless specifically approved by the Office of Congressional Relations.

RELEASED

GAO/RCED-89-205FS

United States General Accounting Office Washington, D.C. 20548

Resources, Community, and Economic Development Division

B-222217

September 28, 1989

The Honorable Guy V. Molinari Ranking Minority Member Subcommittee on Investigations and Oversight Committee on Public Works and Transportation House of Representatives

The Honorable Glenn M. Anderson Chairman, Committee on Public Works and Transportation House of Representatives

This fact sheet supplements the work contained in our two reports concerning conditions within the air traffic control work force.<sup>1</sup> The information responds to your request that we highlight the controller and supervisor survey differences between Chicago center and all centers. This fact sheet also shows how air traffic controllers at the Chicago air route traffic control center and their supervisors feel about their working conditions and other aspects of the air traffic control system, including morale.

In summary, Chicago center controllers and supervisors, overall, are more concerned than those at other centers about the extent and quality of developmental controllers'<sup>2</sup> skills and training. At the same time they are less concerned than their counterparts at all centers about meeting the need for controllers in the future because of the number of developmental controllers that they currently have.

As with other center controllers, Chicago center controllers expressed their concerns about various working conditions, including too few full performance level controllers; too much work; too little overtime to cover training, leave, and

<sup>1</sup>Aviation Safety: Serious Problems Continue to Trouble the <u>Air Traffic Control Work Force</u> (GAO/RCED-89-112, Apr. 21, 1989) and <u>Aviation Safety: Conditions Within the Air Traffic</u> <u>Control Work Force</u> (GAO/RCED-89-113FS, Apr. 24, 1989).

<sup>2</sup>A developmental controller is one who is undergoing training. Developmentals control traffic as they become proficient in a defined area.

other duties; inadequate quality of developmental training; and low morale. Additionally, they viewed airlines and pilots as contributing to controller difficulty and, from an air traffic system perspective, rated factors that made it difficult to keep the air traffic system safe. Supervisors shared many of these concerns.

For this analysis, we compared the 1988 Chicago center questionnaire responses with those of all 20 traffic centers (including Chicago), which control flights between airports and over oceanic routes. Section 1 illustrates some of the more striking comparisons of Chicago center controllers with all controllers and of Chicago center supervisors with all supervisors. Section 2 is a complete comparison of controller responses to all survey questions, and section 3 is a complete comparison of supervisor responses.

In addition, section 4 shows how controllers who answered a question on their morale responded to certain other survey questions. The morale data are arrayed to examine relationships between controllers whose morale was "very high," "high," "neither high nor low," "low," and "very low" and their background and working environment. For example, all controllers with "very high" morale were post-strike controllers--those with 1- to 6-years experience controlling traffic with the Federal Aviation Administration (FAA) at the time of our survey.

Overall, on the basis of survey samples of controllers and supervisors, we estimate that 3,635 center controllers and 614 center supervisors would have responded had we sent questionnaires to all controllers and supervisors. Similarly, we estimate that 202 Chicago center controllers and 33 Chicago center supervisors would have responded to our questionnaire.

Section 5 contains our overall survey objective, scope, and methodology, including our questionnaire procedures and sampling methods. Appendix I lists the 20 air route traffic control centers included in our 1988 survey. We plan to issue a more comprehensive report later this year comparing how specific facilities ranked relative to each other for selected survey questions.

FAA provided comments on the development of our questionnaire. However, as you requested, we did not obtain its official comments on a draft of this fact sheet. As

B-222217

arranged, unless you publicly announce its contents earlier, we plan no further distribution of this fact sheet until 30 days from the date of this letter. At that time we will send copies to the Secretary of Transportation; the Administrator, FAA; and other interested parties.

If you have any questions about this fact sheet, please call me on (202) 275-1000. Major contributors to this fact sheet are listed in appendix II.

Kenneth M. Mead Director, Transportation Issues

#### SECTION 1

## SELECTED COMPARISONS OF CONTROLLERS' AND SUPERVISORS' VIEWS

The views presented below are based on survey samples of controllers and supervisors at all centers, including Chicago. Overall, the views of Chicago center controllers differed somewhat from those of all center controllers in the general areas of work load, staffing, overtime, training, safety, and morale. The views of Chicago center supervisors also differed somewhat from those of all center supervisors.

#### CONTROLLERS' VIEWS

#### Work Load

Chicago controllers were less likely to work excessively during peak periods than all center controllers.

-- 14 percent of Chicago controllers (compared with 37 percent of all center controllers) said they typically worked over 2 hours on position continuously during daily peak periods.

#### <u>Staffing</u>

Chicago center controllers were more concerned than were all centers that they had too many developmental controllers to train but were less concerned than all centers about their ability to meet the future need for controllers.

- -- 84 percent of Chicago controllers (compared with 32 percent of all center controllers) said they had more developmentals than could be trained.
- -- 38 percent of Chicago controllers (compared with 65 percent of all center controllers) said they had too few developmental controllers to meet future controller needs.

#### Overtime

About three of every five Chicago controllers believed more overtime was warranted at their facility, but about one of every four controllers responded that they were working less overtime than they wanted, somewhat higher rates than at all centers.

-- 61 percent of Chicago controllers (compared with 50 percent of all center controllers) said they had too little overtime to cover training, leave, and other duties. -- 98 percent of Chicago controllers had worked overtime in the past 12 months (compared with 76 percent of all center controllers). Of those working overtime, 28 percent of Chicago controllers said it was less than they wanted (compared with 22 percent of all center controllers).

## Training

Chicago controllers expressed greater concern than did all center controllers about (1) the skill level of developmentals and (2) developmentals' not receiving sufficient training involving live traffic.

- -- 47 percent of Chicago controllers (compared with 35 percent of all center controllers) said developmental controllers were "probably not" or "definitely not" provided with sufficient training involving live traffic before being certified on position.
- -- 62 percent of Chicago controllers (compared with 47 percent of all center controllers) said the overall skill of developmental controllers when arriving on the floor for on-the-job training was worse than 3 years previously.

### Safety

Chicago center controllers rated the overall safety of the traffic system about the same as did all center controllers. However, Chicago controllers expressed greater concern about their ability to maintain that safety in three specific areas: developmentals' skill level and hardware and software reliability.

- -- 69 percent of Chicago controllers (compared with 52 percent of all center controllers) said the current skill level of developmental controllers was hindering the maintenance of system safety.
- -- 71 percent and 59 percent, respectively, of Chicago controllers (compared with 58 percent and 46 percent, respectively, of all center controllers) said current hardware and software reliability was hindering the maintenance of system safety.

## <u>Morale</u>

Chicago center controllers' morale was not as high as morale at all centers.

-- 24 percent of Chicago controllers said their morale was "high" or "very high" compared with 30 percent of all center controllers. -- 43 percent of Chicago controllers said their morale was "low" or "very low," the same as all center controllers, although there were differences between those who said "low" and "very low."

#### SUPERVISORS' VIEWS

#### Work Load

Chicago supervisors spent too much of their time working traffic, rather than supervising, and recognized it. A higher percentage of Chicago supervisors than all center supervisors believed full performance and developmental controllers did not spend enough time on radar position during peak traffic periods.

- -- Chicago center supervisors typically spent 46 percent of their duty time per pay period working traffic (compared with supervisors at all centers who spent 19 percent of their time). Further, 52 percent of Chicago supervisors (compared with 23 percent of all center supervisors) felt they spent too much of their time working traffic.
- -- 24 percent of Chicago supervisors (compared with 10 percent of all center supervisors) said full performance level controllers did not spend enough time on radar positions during peak traffic periods. Similarly, 32 percent of Chicago supervisors (compared with 10 percent of all center supervisors) expressed similar views about developmental controllers.

## Staffing

Chicago supervisors were much more likely to believe than were all center supervisors that the number of developmental controllers was appropriate to meet future needs and that their center had more developmentals than could be trained.

- -- 72 percent of Chicago supervisors (compared with 34 percent of all center supervisors) said the number of developmental controllers was appropriate to meet future controller needs.
- -- 88 percent of Chicago supervisors (compared with 28 percent of all center supervisors) said they had more developmentals than they could train.

## <u>Overtime</u>

Chicago supervisors were more likely than all center supervisors to believe that too little overtime was allowed at their facility to cover training, leave, and other duties. -- 57 percent of Chicago supervisors (compared with 44 percent of all center supervisors) said too little overtime was allowed so that they could not cover training, leave, and other duties.

## Training

Chicago supervisors rated the (1) quality of developmental training, (2) the number of experienced controllers providing training, and (3) the evaluation of instructor performance as worse than the evaluation given by supervisors at all centers.

- -- 24 percent of Chicago supervisors (compared with 14 percent of all center supervisors) rated the quality of developmental on-the-job training as "poor." The views on some aspects of training that Chicago supervisors rated as "less than adequate" also differed from those of all center supervisors: emergency procedures--76 percent versus 45 percent, handling heavy traffic--36 percent versus 21 percent, phraseology--48 percent versus 20 percent, and flow control procedures--72 percent versus 40 percent.
- -- 64 percent of Chicago supervisors (compared with 27 percent of all center supervisors) did not believe that enough full performance level (FPL) controllers were available to provide on-the-job training (OJT) to developmentals.
- -- 75 percent of Chicago supervisors (compared with 34 percent of all center supervisors) said that the OJT instructor performance was not being properly evaluated.

#### Safety

Chicago supervisors were less likely than supervisors at all centers to rate system safety as "good" or "excellent" and more likely to cite traffic work load as "hindering" their ability to maintain safety.

- -- 32 percent of Chicago supervisors (compared with 63 percent of all center supervisors) rated system safety as "good" or "excellent."
- -- 92 percent of Chicago supervisors (compared with 74 percent of all center supervisors) said the current amount of traffic work load was "hindering" their ability to maintain safety.

## <u>Morale</u>

Chicago center supervisors' morale was not as low as morale at all centers.

9

-- 28 percent of Chicago supervisors said their morale was "low" or "very low" compared with 37 percent of all center supervisors.

#### SECTION 2

## 1988 SURVEY RESULTS FOR ALL CENTERS COMPARED WITH CHICAGO CENTER AIR TRAFFIC CONTROL--CONTROLLERS

#### <u>Responses in percent</u>

Que	stion	All centers	Chicago center
1.	According to FAA records you are employed either as a full performance level (FPL) or developmental level controller certified on at least one radar position. Is this correct?	e	
	<ol> <li>Correct - I am an FPL certified as FPL at <u>this</u> facility</li> <li>Correct - I am a developmental certified on at least one radar</li> </ol>	y. 91	71
	position at <u>this</u> facility. 3. Incorrect - I am <b>Total</b> Estimated respondents	9 * 100 3,635	29 * 1 <b>00</b> 202

- \*Respondents checking incorrect were instructed to not complete the questionnaire and were not included in the results.
- NOTES: (1) "Estimated respondents" is our estimate of the number of center controllers who would have responded had all center controllers received questionnaires. Center controllers were sampled and results calculated using appropriate projections.
  - (2) Percentages may not add to 100 because of rounding.
  - (3) The terms "center," "enroute center," and "air route traffic control center" have the same meaning in this report. "All centers" means the 20 centers in the contiguous United States.
  - (4) Respondents were instructed to "check one" response for each question or part of a question whenever response categories were presented.
  - (5) Responses to some questions or parts of questions are not reported because of the low number of responses.

#### SECTION 3

#### 1988 SURVEY RESULTS FOR ALL CENTERS COMPARED WITH CHICAGO CENTER AIR TRAFFIC CONTROL--FIRST-LINE SUPERVISORS

Responses in percent

Que	stion	All centers	Chicago center
1.	According to FAA records you are a first-line supervisor. Is this correct?		
	1. Correct (%)	100	100
	2. Incorrect - I am	*	*
	Total	100	100
	Estimated respondents	614	33

\*Respondents checking incorrect were instructed to not complete the questionnaire and were not included in the results.

NOTES:	(1)	"Estimated respondents" is our estimate of the number
		of center supervisors who would have responded had all
		center supervisors received questionnaires. Center
		supervisors were sampled and results calculated using
		appropriate projections.

- (2) Percentages may not add to 100 because of rounding.
- (3) The terms "center," "enroute center," and "air route traffic control center" have the same meaning in this report. "All centers" means the 20 centers in the contiguous United States.
- (4) Respondents were instructed to "check one" response for each question or part of a question whenever response categories were presented.
- (5) Responses to some questions or parts of questions are not reported because of the low number of responses.

Question		All centers	Chicago center	
23.	Overall, how do you rate the quality of on-the-job training (OJT) that developmentals currently receive at your facility?			
	1. Excellent	7	0	
	2. Good	40	20	
	3. Adequate	39	56	
	4. Poor	13	24	
	5. Very poor	1	0	
	Total	100	100	
	6. No basis to judge <sup>a</sup>	0	0	
	Estimated respondents	613	33	
24.	Do you believe developmental controllers are provided with sufficient training involving live traffic before being certified on a position?			
	1. Definitely yes	39	24	
	2. Probably yes	40	52	
	3. Uncertain	4	0	
	4. Probably not	13	16	
	5. Definitely not	4	8	
	Total	100	100	
	6. No basis to judge <sup>a</sup>	0	0	
	Estimated respondents	610	33	
25.	Does your facility have an adequate amount of simulator equipment?			
	1. Definitely yes	18	4	
	2. Probably yes	45	56	
	3. Uncertain	10	8	
	4. Probably not	18	16	
	5. Definitely not	10	16	
		10 <b>100</b> 608	16 100 33	

Question		All centers	Chicago center
26.	To what extent, if at all, is your facility's simulator equipment used by developmental controllers?		
	<ol> <li>Very great extent</li> <li>Great extent</li> <li>Moderate extent</li> <li>Some extent</li> <li>Little, or no extent         Total</li> </ol>	13 35 27 21 4 100	4 36 32 20 8 100
	6. Don't know; uncertain <sup>a</sup> Estimated respondents	3 587	0 33

27. Are there currently enough FPLs available to provide OJT to all developmentals (either to new developmentals or those from other facilities)? If you work at an enroute center, answer for your area of specialization; if you work at a terminal, answer for your schedule.

#### SECTION 4

### HOW CHICAGO CENTER AIR TRAFFIC CONTROLLERS WHO RESPONDED TO THE QUESTION ON THEIR MORALE ANSWERED SEVEN OTHER SURVEY QUESTIONS

#### INTRODUCTION

The following sets of data show how Chicago Center controllers who responded to the morale question answered other selected questions. To illustrate, questions 28 and 2 are shown on the following page. The left two columns show the percentage of controllers who responded to each of the five possible answers to question 28 on the level of their morale. For example, 5.6 percent of the estimated 197 controllers who responded to both questions said their morale was "very high."

The right of the page shows how the controllers who responded to each of question 28's five answers also responded to question 2 about how much traffic they handle during typical daily peak periods. For example, of the 5.6 percent of Chicago center controllers who said their morale was "very high," 16.5 percent said they handled "somewhat more" traffic than they should be during typical daily peak periods.

Because of rounding or omitting a negligible number of responses, the total of the five responses to question 2 may not equal 100 percent.

Two other items should be noted:

- (1) The "estimated respondents" is our estimate of the number of controllers at Chicago center who would have responded to both questions had all center controllers received questionnaires. Chicago center controllers were sampled and results calculated using appropriate projections.
- (2) Percentages may not add to 100 because of rounding.

In general, how would you describe <u>your</u> morale as a controller at this facility? Consider the complexity of the sectors you work and your capabilities as a controller. While working radar during typical daily peak periods, do you believe you are typically required to handle more traffic than you should be handling, less traffic than you should be handling, or an appropriate amount of traffic?

			Question 2				
		p	percent of question 28 responses				
Question 28	Percent of <u>response</u>	Much more than I should be <u>handling</u>	I should	level of	f be	should be

Estimate	d	12.1	53.3	31.8	2.8	a	

<sup>a</sup>No controller responded.

<u>Question 9</u>

Chicago center controller morale.

Do you believe the amount of time you are typically required to continuously work a position without a break during peak periods is too long, too short, or appropriate?

## Question 9-percent of question 28 responses

### SECTION 5

#### OBJECTIVE, SCOPE, AND METHODOLOGY

The Ranking Minority Member, Subcommittee on Investigations and Oversight, House Committee on Public Works and Transportation, and the Chairman, House Committee on Public Works and Transportation, requested that we update and replicate our previous evaluation of the air traffic control system.<sup>1</sup> To accomplish this, we mailed separate questionnaires to air traffic controllers, first-line supervisors of controllers, and facility managers at the 84 largest air traffic control facilities. Subsequently, the congressional requesters asked that we provide the survey results for the Chicago center. Thus, this report focuses on the survey responses of Chicago center controllers and supervisors compared with similar responses at all centers.

The following sections provide details on our scope and methodology in designing and administering the questionnaires and estimating the overall results.

#### <u>SCOPE</u>

Our 1988 survey included the 84 largest air traffic control facilities, consisting of all 20 air route traffic control centers in the continental United States and all 64 of the largest terminal facilities (level 4 and 5) in March 1988, the survey selection period. This report focuses on the 20 centers, particularly Chicago. Appendix I shows the specific centers included in the 1988 survey.

We summarized the problems concerning the air traffic control work force in our report, <u>Aviation Safety: Serious Problems</u> <u>Continue to Trouble the Air Traffic Control Work Force</u> (GAO/RCED-89-112, Apr. 21, 1989). The complete responses to all survey questions are contained in our fact sheet, <u>Aviation</u> <u>Safety: Conditions Within the Air Traffic Control Work Force</u> (GAO/RCED-89-113FS, Apr. 24, 1989). We performed our review from November 1987 to December 1988, in accordance with generally accepted government auditing standards.

#### METHODOLOGY

Between May 2 and August 5, 1988, we surveyed the air traffic control work force. Specifically, we mailed similar, but not identical, questionnaires to (1) full performance level controllers and developmental level controllers certified on at least one radar

<sup>1</sup><u>Aviation Safety: Serious Problems Concerning the Air Traffic</u> <u>Control Work Force</u> (GAO/RCED-86-121, Mar. 6, 1986). position, (2) first-line supervisors of controllers, and (3) facility managers. The topics of the survey included work load, staffing, overtime, training, system safety and air traffic control operations, operational error detection, and retirement.

To meet our objectives, we replicated questions from the 1985 survey. To gain further insight into a variety of issues--such as working conditions, safety, and morale--we added questions to the 1988 survey. In developing the questionnaires, suggested changes were provided by the Ranking Minority Member, FAA, the National Transportation Safety Board, and the controllers' union. Individual controller, supervisor, and manager comments were considered during our questionnaire pretesting at nine specific FAA facilities.

We designed three separate questionnaires for each of the three work force components for both the 1988 and 1985 surveys. Each questionnaire was designed to gain a unique perspective of the air traffic work force: controllers directly work and control air traffic primarily using radar; first-line supervisors represent a manager's view and also reflect personal observations from directly working and controlling traffic; facility managers represent the perspective of FAA field management. This report does not contain facility managers' views, particularly Chicago center's facility manager, because we pledged confidentiality.

#### Research Design

To establish the universe of controllers, we used an FAA computer file, containing names and home addresses, of all controllers (GS-2152 series) employed at the 84 largest facilities as of March 23, 1988. Since some of the controllers on this file were not radar qualified, we developed criteria in consultation with FAA to identify qualified controllers. This procedure identified 7,742 air traffic controllers; however, the criteria to screen FAA's file for radar-certified controllers were inexact. Therefore, we included a screening question in the questionnaire to more precisely identify full performance level controllers and developmental controllers who were certified on at least one radar position.

We used a similar selection and screening process for firstline supervisors and identified 1,196.

We sent all facility managers at the 84 largest facilities questionnaires. FAA provided a list of the facility managers' names and addresses. At four terminals (Chicago, Dallas-Fort Worth, Denver, and St. Louis), FAA has one manager overseeing two facilities, or organizational components--the control tower and the terminal radar approach control, or TRACON, facility. Thus, questionnaires were sent to 80 facility managers.

### Sample, Universe, and Return-Related Data

The largest FAA facilities in the air traffic control system consist of air route traffic control centers, which control flights between airports, and terminal facilities. Because a center has a considerably greater number of controllers and supervisors than does a terminal, we used a stratified sample at centers for selection; at terminals, all controllers and supervisors were sent questionnaires. Table 5.1 shows universe, sample, and returnrelated data for the 1988 survey.

### Table 5.1: Universe, Sample, and Return-Related Data for the Three Questionnaires Used in the 1988 Survey

### Survey Results

We used stratified sampling at centers and assigned appropriate weights to sampled cases prior to analyzing the survey results. Thus, responses shown for centers represent weighted estimates. We estimate that 3,635 center controllers and 614 center supervisors would have responded had we sent questionnaires to all controllers and supervisors. Similarly, we estimate that 202 Chicago center controllers and 33 Chicago center supervisors would have responded to our questionnaire.

Sample estimates are subject to a certain amount of sampling error (the possible error that arises because of taking a sample rather than surveying the entire population). Sampling error is also referred to as a precision of the estimate and is typically given as a plus and minus percentage around the estimated percent.

We computed sampling errors for the survey questions discussed in section 1 of this report. The sampling errors ranged as follows: for Chicago center controllers, 1.7 percent to 8.2 percent; for Chicago center supervisors, 4.7 percent to 9.9 percent; for all center controllers, 1.2 to 2.2 percent; and for all center supervisors, 0.4 percent to 1.5 percent.

To ensure that it was appropriate to compare "Chicago center" responses to "all centers" responses, which include Chicago, we

compared the controller and supervisor responses for the 19 centers (other than Chicago) to all 20 centers. The results of our comparison show little change (3 percent or less) between responses to survey questions.

### Questionnaire Procedures

The 1988 questionnaires were developed using the 1985 questionnaires as our starting point. We added and deleted questions based on suggestions provided by the Ranking Minority Member, FAA officials, the National Transportation Safety Board, union officials, and members of the air traffic control work force. We conducted pretests with a total of 36 individuals at 9 facilities: 4 centers (Cleveland, Jacksonville, Oakland, and Seattle) and 5 terminal facilities (Cleveland, Jacksonville, Oakland TRACON, Orlando, and Seattle TRACON).

During each session, an individual respondent filled out a questionnaire in the presence of two GAO observers. The GAO observers timed the respondent and observed reactions to questions and question flow. Afterwards, the observers debriefed the respondent to identify ambiguities, incorrect use of technical language, potential bias, or other problems in question wording or questionnaire format.

Questionnaires for controllers and supervisors were mailed to the respondents' home address. If a home address was not available, questionnaires were mailed to controllers at the facilities where they worked. Questionnaires for the facility managers were also mailed to each facility.

Because of the sensitive nature of some questions, respondents were promised confidentiality to encourage a reply. The only exception to this pledge was one section of staffing questions on the 1988 facility manager questionnaire. The facility managers were informed that information in this section could be specifically identified to their facilities.

In order to maintain confidentiality, a control number was written on each questionnaire to identify the respondents without using their names and to facilitate follow-up mailings. The nonconfidential section of the managers' questionnaire was detached and processed separately so that no identification remained on the confidential questions.

On June 6, 1988, we sent follow-up letters to all nonrespondents. The letters also included a second copy of the questionnaire in case the respondent could not locate the original. We subsequently phoned some facility managers to clarify facility staffing information.
