EPA Efforts to Address Children's Health Issues Need Greater Focus, Direction, and Top-level Commitment

What GAO Found

EPA has not proactively used the Advisory Committee to ensure that the agency's regulations, guidance, and policies address the disproportionate risks that environmental contaminants pose to children. Our analysis found that the Advisory Committee met more than 30 times and discussed a variety of environmental health issues with dozens of officials from EPA offices such as Pesticides and Toxic Substances, and Research and Development. However, we identified just three instances where EPA specifically asked the committee for recommendations and advice on regulations—most notably an October 1997 request that the committee identify five regulations or standards for EPA to re-evaluate in order to better protect children. In the absence of focus and direction from EPA, the Advisory Committee has taken the initiative to write more than 70 letters to the Administrator since 1998 containing hundreds of recommendations on a wide variety of children's health concerns.

EPA has not addressed key recommendations from its Advisory Committee, particularly those in a major April 2007 letter and in recent letters advising EPA on proposed revisions to national air quality standards. The April 2007 letter, which marked the 10th anniversary of the Executive Order, provided recommendations in seven key areas. These included the need for EPA to eliminate environmental health disparities among low-income and minority children. While EPA generally responds to the Advisory Committee's letters, the agency has not fulfilled the Administrator's commitment in his response to the 10th anniversary letter to collaboratively review recommendations from the advisory committee. The Office of Children's Health had begun forming internal workgroups, but a new acting director stopped the process in late 2007 to hold individual meetings with EPA's assistant administrators, and the process remains stalled. We also analyzed EPA's responses to the committee's specific recommendations on three recently-considered EPA air quality standards—the National Ambient Air Quality Standards for particulate matter, ozone, and lead—and we found that EPA either offered to consider the committee's recommendations as part of the public comment process or rejected them.

The President's Task Force, which was authorized in April 1997, provided high-level interagency leadership and coordination on children's environmental health, but it expired in April 2005. According to the children’s health experts with whom we spoke, the task force provided important leadership on initiatives such as the National Children's Study and the Healthy Schools Environmental Assessment Tool. The task force also developed federal strategies to address four threats to children—asthma, developmental disorders, cancer, and unintentional injuries. In 2003, the President ordered the task force to be extended by 2 years, but the order eliminated the provision for reassessing the task force. Since the task force's expiration, EPA no longer has a high-level infrastructure or mandate to coordinate federal strategies for children's environmental health and safety.
