CONSUMER PRODUCT SAFETY COMMISSION

Better Data Collection and Assessment of Consumer Information Efforts Could Help Protect Minority Children

What GAO Found

Few studies have assessed racial and ethnic differences in child death rates from injuries related to consumer products, and CPSC has not analyzed whether specific racial or ethnic groups are disproportionately affected by product hazards because of data limitations. These limitations include incomplete and inconsistent race and ethnicity data on emergency room reports and the inconsistent presence of product-related information on death certificates. In 2007, race and ethnicity data were not coded in about 31 percent of cases in CPSC’s National Electronic Injury Surveillance System (NEISS), which collects data from a nationally representative sample of hospital emergency rooms. In addition, the hospitals that do record race and ethnicity information in CPSC’s NEISS system do so inconsistently, in part because of limited CPSC guidance. While death certificates may include more complete race and ethnicity information compared with nonfatal injury data from hospitals, related product information is not consistently documented on the certificates.

Despite this lack of data, CPSC has developed or modified some consumer information efforts to reach specific minority populations, but it has not assessed the results of these efforts. CPSC provides information in Spanish for many of its outreach efforts, including its telephone hotline, Web site, television, radio, and print publications. CPSC has also identified and established relationships with other organizations to help disseminate consumer safety information to minority communities. And while CPSC has used some consumer input to develop safety information, it has not assessed outreach efforts for specific audiences. CPSC has also established goals for its overall consumer information efforts, but not for its messages targeted to specific populations. In addition, CPSC relies on its Neighborhood Safety Network, a group of organizations that have expressed interest in receiving product safety information, to share information with audiences that can be hard to reach, but the agency has not assessed whether these populations are receiving and using the information. Organizations we contacted for this report, including Neighborhood Safety Network members and children’s safety groups, generally reported using safety information provided by CPSC, but some offered suggestions for improvement of efforts to reach minority communities, such as providing safety information in other languages and additional exposure through broadcast media.

What GAO Recommends

GAO recommends that CPSC develop and implement cost-effective means of improving data collection on factors that may contribute to any differences in the incidence of consumer product-related injury and death. GAO also recommends that CPSC develop and implement cost-effective ways to enhance and assess the likelihood that safety messages are received and implemented by all the intended audiences. CPSC and the Department of Health and Human Services (HHS) agreed with GAO’s recommendations.
